

# Getting clarity by defining Artificial Intelligence — A survey

Dagmar Monett<sup>1,2</sup> and Colin W. P. Lewis<sup>1,3</sup>

<sup>1</sup>: AGISI.org, <sup>2</sup>: Berlin School of Economics and Law, Germany, <sup>3</sup>: University of Ecology and Management, Warsaw, Poland

## Motivation

- "It is very hard to define what intelligence is." (Kambhampati, 2017)
- There is a **lack of a coherent identity and goal for AI** (Nilsson, 2010)
- Smale's problem number 18, *The Limits of Intelligence* — intelligence **remains unsolved**. There is still a need for "a broader study [...], one which involves deeper models of the brain, and of the computer, in a search of what artificial and human intelligence have in common, and how they differ" (Smale, 1998).
- Creating an **agreed upon message** on the goal and definition of AI is **far from obvious or straightforward**.
- **Our work**: **partial results**, research survey **Defining (machine) Intelligence** [So far for the **first 400 responses**, the survey is still accepting responses! <https://goo.gl/hMjaE1>]
- **Aim**: to gather opinions, from a cross sector of professionals, ultimately **to help create a unified message on the goal and definition of AI**

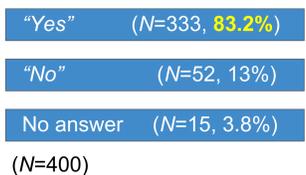

Kambhampati, S. (2017). On the Past and Future of AI. Interviews with Experts in Artificial Intelligence. Iridescent. Retrieved from <https://goo.gl/nspv6y>.

## Survey stats. Preliminary results

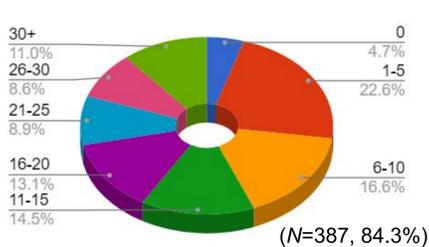

- **400+** fully completed responses by September 10th, 2017
- ◆ Respondents from **48 countries**
  - Top nationality: United States (35%), Germany (6.3%), France (5.8%), United Kingdom (5.5%), Italy (4.5%)
  - Top country of work: United States (37.5%), United Kingdom (9.3%), France (6%), Germany (4.5%), Canada (3.3%)
- ◆ **131 different institutions** (N=146, 36.5%)
  - Top: Microsoft, INRIA, Virginia Tech
- Branch, top three:
  - ◆ **Academia** (N=308, **77%**)
  - ◆ **Industry** (N=85, 21.3%)
  - ◆ **NGO, Not-for-Profit** (N=10, 2.5%)
- Role, top three:
  - ◆ **Researcher** (N=301, **75.3%**)
  - ◆ **Educator** (N=144, 36%)
  - ◆ **Developer, Engineer** (N=67, 16.8%)

### Work in Artificial Intelligence

Do you work or have worked in Artificial Intelligence?

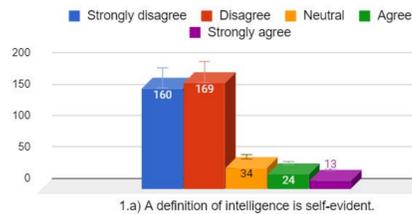

Years of experience in AI

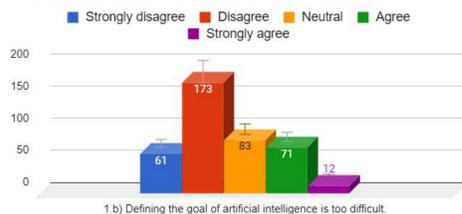

## Consensus on defining the goal of AI

Questions adapted from (De Boeck, 2013). De Boeck, P. (2013). Intelligence, Where to Look, Where to Go? J. Intell. 1:5-24.

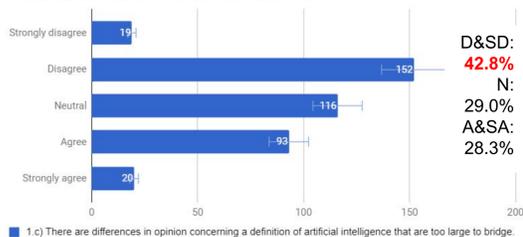

Level of consensus with the statement 1.a.

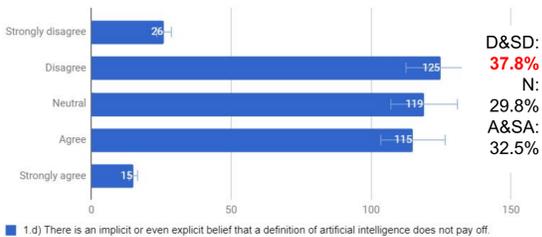

Level of consensus with the statement 1.b.

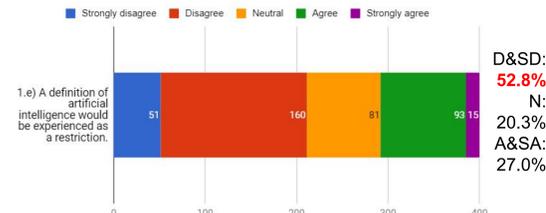

Level of consensus with the statement 1.c.

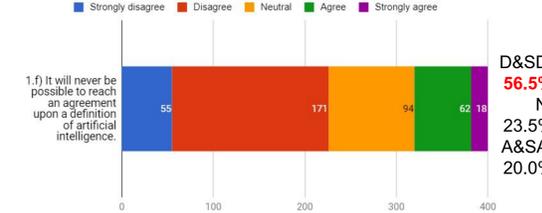

Level of consensus with the statement 1.d.

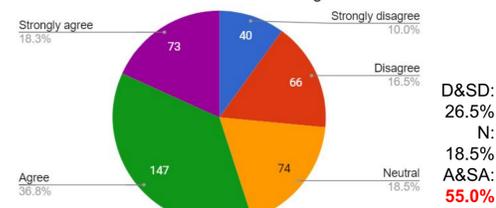

Level of consensus with the statement 1.e.

Level of consensus with the statement 1.f.

Level of consensus with the statement 1.g.

## Conclusions

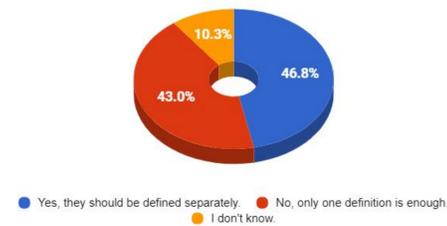

- Significant volume of responses from around the world.
- High level comments and recommendations concerning definitions of MI and HI.
- Highly polarized: one vs. separate definitions of MI and HI.
- **Work in progress**: concept analysis suggested defs, catalog of factors contributing to intelligence, methodology for and best practices to be applied when defining (machine) intelligence
- We hope we can help to spread a stronger, more coherent message, to the mainstream media, policymakers, investors, and the general public to help dispel myths about AI.

## Definitions of human and machine intelligence

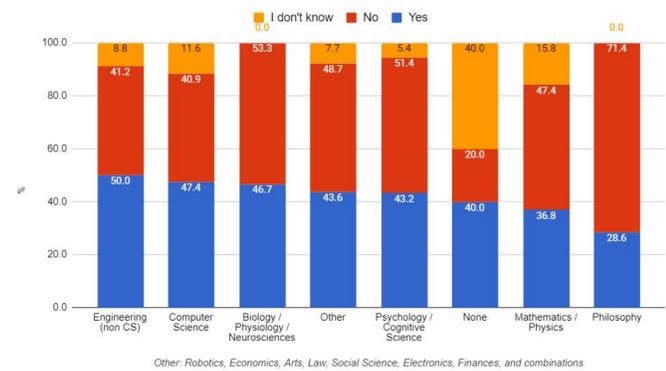

### Level of consensus regarding separate definitions of human and machine intelligence

Many respondents (N=187, **46.8%**) expressed agreement or strong agreement concerning the need for having **separate definitions of human and machine intelligence**, although a slightly equal number (N=172, 43%) indicated that only one definition is enough.

Should a definition of intelligence differentiate between "human" and "machine" intelligence?

Should a definition of intelligence differentiate between "human" and "machine" intelligence?

### (known) Definitions of machine intelligence

(Bostrom, 2014; Goertzel, 2010; Laird et al., 2009; Legg & Hutter, 2007; Lewis & Monett, 2017; Nilsson, 2010; Russell & Norvig, 2010; Wang, 2008; Winston, 1992)

#### Most accepted definition:

"The essence of intelligence is the principle of adapting to the environment while working with insufficient knowledge and resources. Accordingly, an intelligent system should rely on finite processing capacity, work in real time, open to unexpected tasks, and learn from experience. This working definition interprets "intelligence" as a form of "relative rationality." (Wang, 2008)

D&SD: 20.5%  
 Neutral: 23.5%  
 A&SA: **56.0%**  
 Mdn: "Agree"  
 Mo: "Agree"

### (known) Definitions of human intelligence

(Anastasi, 1986; Bigge, 1976; Deary, Penke, & Johnson, 2010; Fontana, 1988; Gottfredson, 1997; Humphreys, 1984; Stanovich, 2014; Sternberg, 1986; Wechsler, 1939)

#### Most accepted definition:

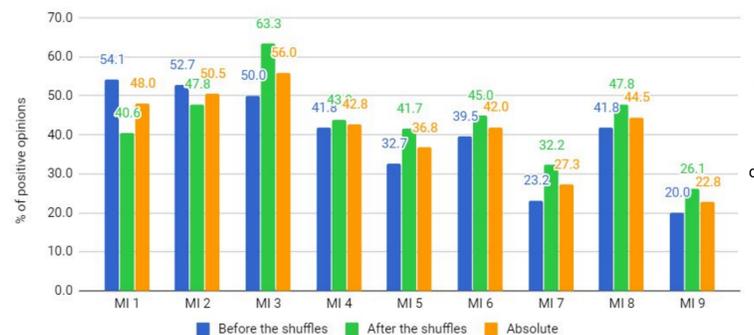

"Intelligence is a very general mental capability that, among other things, involves the ability to reason, plan, solve problems, think abstractly, comprehend complex ideas, learn quickly and learn from experience. It is not merely book learning, a narrow academic skill, or test-taking smarts. Rather it reflects a broader and deeper capability for comprehending our surroundings — "catching on," "making sense" of things, or "figuring out" what to do." (Gottfredson, 1997)

D&SD: 16.7%  
 Neutral: 21.8%  
 A&SA: **61.5%**  
 Mdn: "Agree"  
 Mo: "Agree"

## Cognitive bias: Anchoring effect?

The **percentages of positive opinions decrease** — Strong dependence on the position of the definition.

→ Cognitive bias? It seems respondents tend to rely heavily on the first definitions (the "anchors") that are presented. 7 out of 9 MI definitions benefit from random positioning. HI defs: same behaviour.

## Participants' suggested definitions

→ **Definitions**, related opinions, and feedback:

- ◆ **213** (53.3%) suggested definitions of or opinions on **machine intelligence**
- ◆ **142** (35.5%) suggested definitions of or opinions on **human intelligence**
- ◆ **99** (24.8%) **feedback** comments and/or **literature suggestions**
- ◆ **222** (55.5%) email addresses provided: **follow up** and **inclusion** of definitions

"Intelligence is the art of rapid and reliable gist-finding, crux-spotting, bull's-eye hitting, nub-striking, essence-pinpointing. It is the art of, when one is facing a new situation, swiftly and surely homing in on an insightful precedent (or family of precedents) stored in the recesses of one's memory. That, no more and no less, is what it means to isolate the crux of a new situation. And this is nothing but the ability to find close analogues, which is to say, the ability to come up with strong and useful analogies."  
 —Douglas Hofstadter, Indiana University.

"Intelligence is the ability to do the right thing at the right time given a dynamic environment (that is, a shifting landscape of "right times" requiring more "right things"). AI is intelligence constructed deliberately as an artefact of a culture."  
 —Joanna Bryson, University of Bath and Princeton University.

"A system is intelligent with respect to the standards of a given society with limited physical resources if it can quickly solve or learn to solve a wide variety [of] problems considered relevant and challenging by this society."  
 —Jürgen Schmidhuber, Swiss AI Lab, IDSIA, NNAISENSE.
